FOR IMMEDIATE RELEASE

**BIONETIX INTERNATIONAL COLLABORATES WITH THE NATIONAL RESEARCH COUNCIL BIOTECHNOLOGY RESEARCH INSTITUTE (NRC-BRI)**

*Montreal, November 12, 2007* - BIONETIX INTERNATIONAL is pleased to announce it has undertaken a collaborative research project in conjunction with NRC-BRI. The proposed collaborative project involves the development and optimization of the fermentation process for the production of selected bacterial strains used in various bioremediation processes.

BIONETIX INTERNATIONAL is a Montreal biotechnology company that produces microbial-based products for use in environmental microbiology and bioremediation. The joint NRC-BRI and BIONETIX research project will permit the company to develop superior performance microbiological products, and to gain more control of the production aspects of its operations. This project will result in the creation of biomanufacturing jobs in Canada.

The NRC Industrial Research Assistance Program (NRC-IRAP) is providing technical advisory services and financial support in the development of these new biotechnology products.

At BIONETIX INTERNATIONAL we work for nature . . . anywhere in the world . . . anytime our customers need us. We promote a healthy environment by providing superior, environmentally safe alternatives to current treatment methods. Through the application of our biotreatment products to polluted systems, our customers are able to remediate these contaminated systems in a cost-effective, natural and non-intrusive way. The expertise of our employees permits us to offer our clients timely technical support to develop tailor-made solutions for special applications.
